

# Lab Prep

## Session 1: Fiber Reinforced Composites

CE 331  
Spring 2014

# Session 1 Objectives

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

- Measure  $E$  in flexure
- Measure variation in  $E$  with respect to reinforcement orientation

# Materials

## Session 1

→ Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

- Continuous Fiber Reinforced Polymer (FRP)
- Cut from the same sheet at different angles
- These are brittle – be careful with them!

**Edges can be sharp!**

# Midpoint Deflection

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

- $E$  in flexure = beam deflection
- Similar to ASTM D143 for wood

- $$\Delta = \frac{PL^3}{48EI}$$

$\Delta$ : mid-span deflection (mm)

$P$ : applied load (N)

$L$ : length between supports (150mm)

$E$ : Young's Modulus

$I$ : moment of inertia ( $bh^3/12$ )

# Experimental Setup

## Session 1

→ Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

- Width/thickness
- No weight – zero gauge
- Hang weight and read mdpt  $\Delta$
- Masses of: 500, 750, 1000, 1250 g

$$\text{Weight [N]} = \text{mass [kg]} * 9.81 [\text{m/s}^2]$$

# Calculations

## Session 1

Setup

→ Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

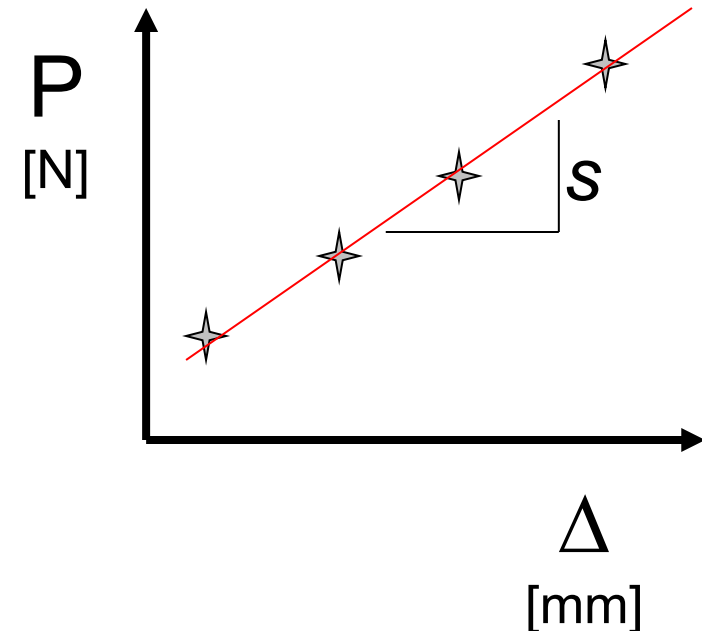

For each specimen:

- Plot  $P$  vs  $\Delta$
- Linear Regression to find slope ( $s$ )
  - Non-zero intercept

- $\Delta = \frac{PL^3}{48EI}$

- $E = \frac{P}{\Delta} \frac{L^3}{48I} = s \frac{L^3}{48I}$

- All specimens on the same figure
- UNITS!

# Reports

## Session 1

Setup

Analysis

→ Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

- Not meant to be a full lab report that you are probably familiar with
- There will not be a *minimum* length requirement
  - Grading will be based on content
  - A few reports during the semester will have a *maximum* limit
- Rubrics will be provided
- If you have questions, ASK US!

# What to include in this Report

## Session 1

Setup

Analysis

→ Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

- This information is provided in the rubric
- Summary (<1 pg)
  - Goals/objectives
  - Method
  - Results/conclusions
- Results
  - Summary (slide 9)
  - Plot of  $P$  vs  $\Delta$
  - Plot of  $E$  vs  $\theta$
- Format/Organization
  - Structure
  - Spelling
  - Sig figs
- Appendix
  - Raw data table (slide 11)
  - Example hand calculation
  - Unit analysis

# Example Summary Table

## Session 1

Setup

Analysis

→ Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

Cut Angle [deg]	Applied Load [N]	Mid-Pt $\Delta$ [mm]	Slope	E [GPa]
0				
22.5				
45				
67.5				
90				

~ 6 GPa

# Example E vs $\theta$

## Session 1

Setup

Analysis

→ Report

## Session 2

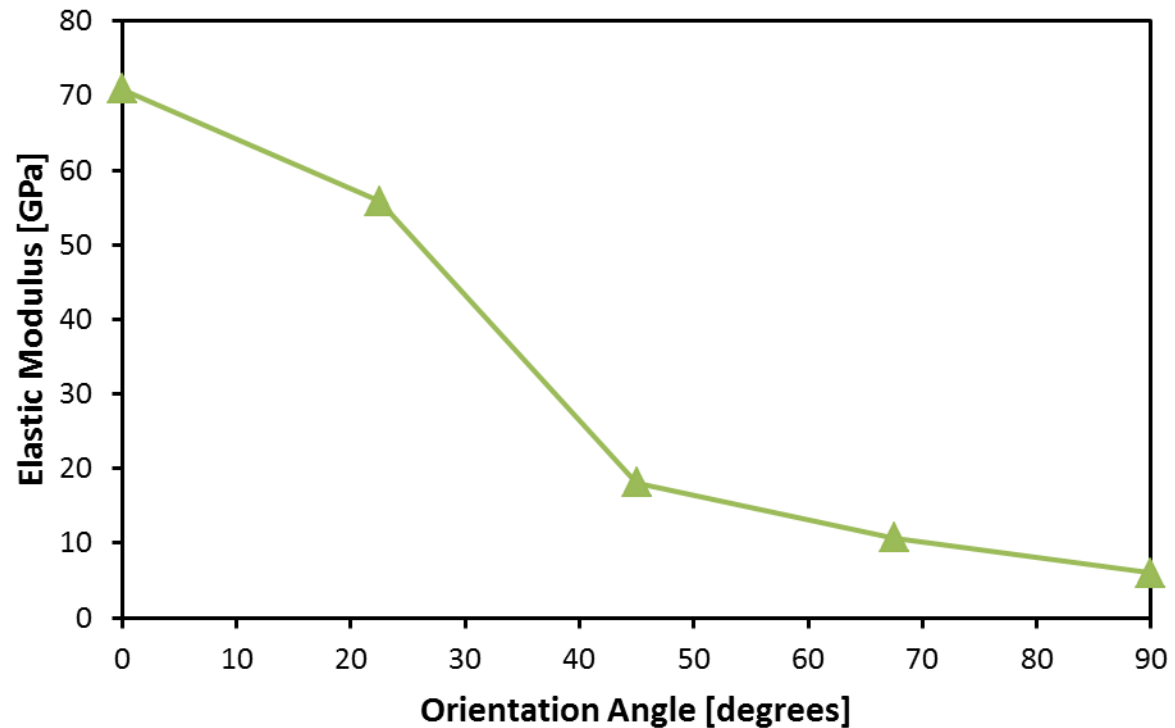

Background

Setup

Task 1

Task 2

Task 3

**Figure 2: Elastic modulus as a function of reinforcement orientation**

# Data Table

Specimen #	Cut Angle [deg]	b [mm]	h [mm]	I [mm <sup>4</sup> ]	Measured Deflection [mm]			
					500 g	750 g	1000 g	1250 g
1	0							
2	22.5							
3	45							
4	67.5							
5	90							

# Lab Prep

## Session 2: Particulate Composites and NDT

CE 331  
Spring 2014

# Non-Destructive Testing (NDT)

## Session 1

Setup

Analysis

Report

## Session 2

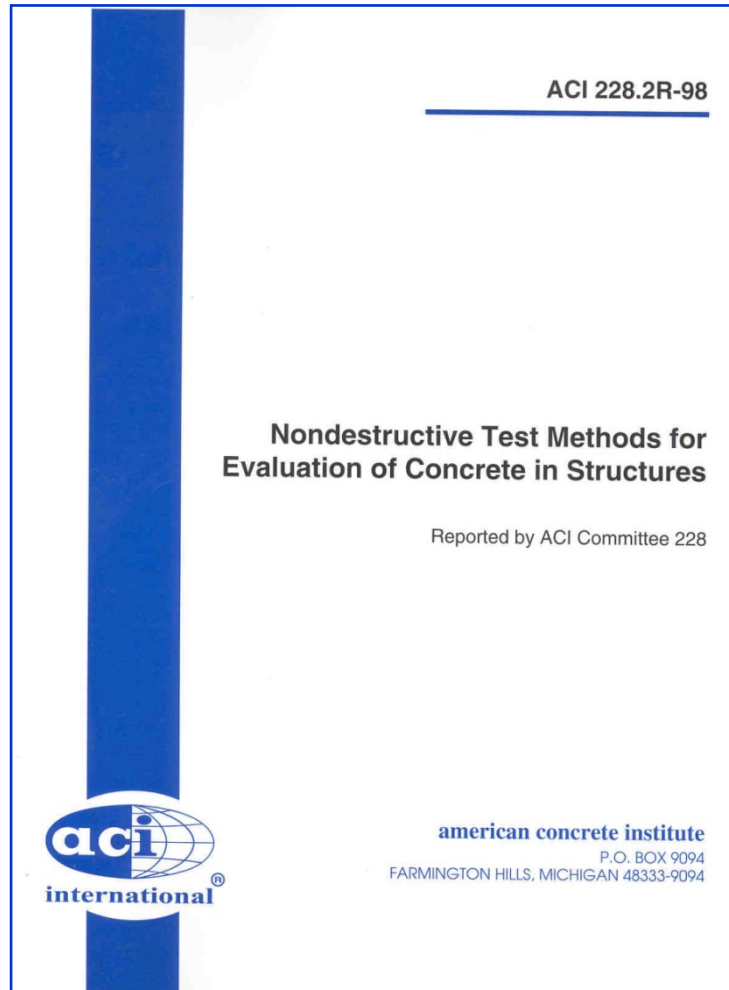

→ Background

Setup

Task 1

Task 2

Task 3

- In situ properties
- Typically strength / stiffness
- Member thickness
- Defects
- Reinforcement
- More recent: durability

# Rebound Hammer

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

Setup

Task 1

Task 2

Task 3

- 50,000+ Sold World Wide
- Can Be Conducted in Any Direction
- Correlate with Cylinders with Indents at 120 Degrees
- ASTM C805
- +/- 15-20%

Push Hammer  
(Store Energy)

Setup

Task 1

Task 2

Task 3

# Drawbacks

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

Setup

Task 1

Task 2

Task 3

- Measure of How Much Energy is Absorbed
- Related to Stiffness (Strength of Concrete)
- Aggregate Dependence
- Sensitive to Local Conditions (Average of 10 Values Reported)
- Near Surface Layer Measurement – Not Core Concrete
- Sensitive To Moisture Conditions at Surface
- Surface (Trowel or Plywood Forms Higher)
- Calibrate with Local Materials
- Rigidity of Test Samples

# Ultrasonics

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

Setup

Task 1

Task 2

Task 3

- Similar to radar, medical ultrasound
- Above audible sound freq
- Sound/Stress waves
- Piezoelectric material converts electricity into stress waves

# Benefits

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

Setup

Task 1

Task 2

Task 3

- May Be Required to Assess To Find Out What Quality of Concrete Was Placed (QC/QA new construction, troubleshooting problems)
- Condition Evaluation of Older Concrete (rehab), Increasingly Common to Find Structures “Deteriorating” From Materials Related Problems
- Quality Assurance of Concrete Repairs
- Able to Assess Large Volumes of Concrete Rapidly

# Principle

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

Setup

Task 1

Task 2

Task 3

- Sound waves travel through materials
- Defects influence travel time
- Voids can reflect or alter wave direction

# Speed of Sound

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

Setup

Task 1

Task 2

Task 3

- Sound travels through materials

- $f \left( \frac{E}{\rho} \right)^{1/2}$

$E$ :elastic modulus

$\rho$ :density

Air

Water

Solid

$$C_{\text{Air}} < C_{\text{Water}} < C_{\text{Solid}}$$

# Types of Waves

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

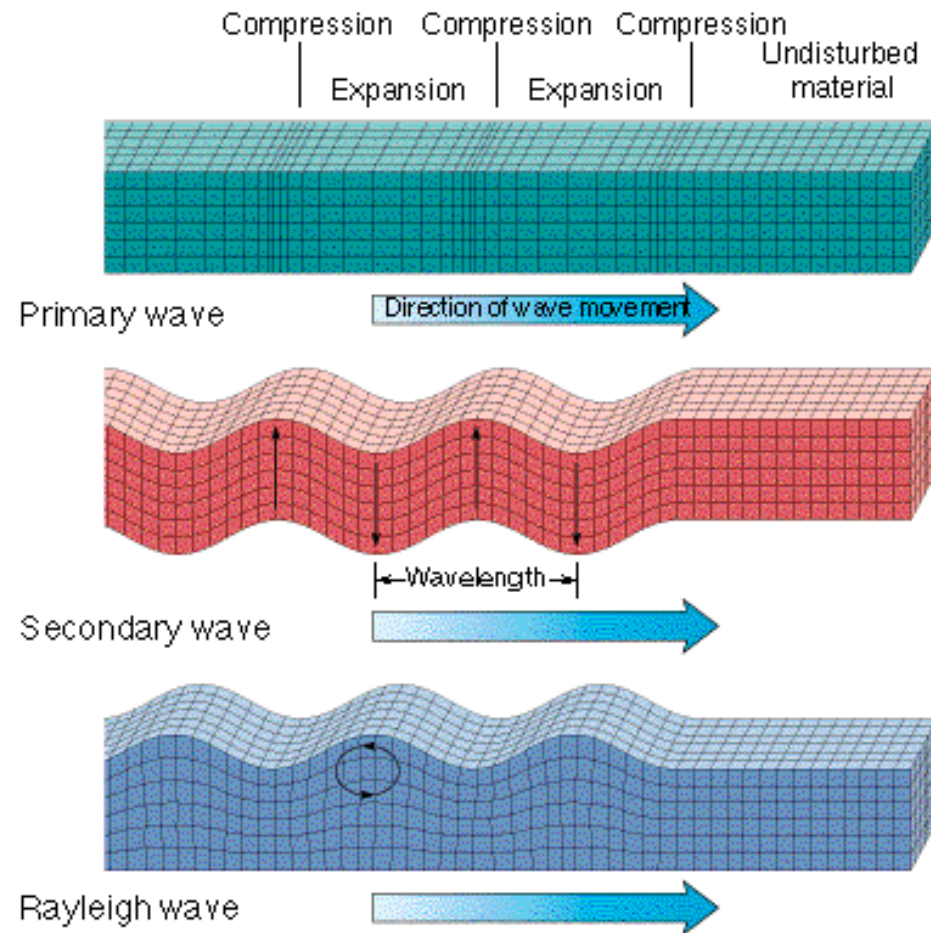

Setup

Task 1

Task 2

Task 3

- Primary\*\*
  - P-wave
  - compression
- Secondary
  - S-wave
  - shear
  - transverse
- Rayleigh
  - surface

# Indirect Transmission (Ultrasonic Pulse Velocity) ASTM C 597

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

Setup

Task 1

Task 2

Task 3

Measure travel time as a function of distance,  $L$ , between transducers; determine depth of interface,  $d$

# Determine “d”

## Session 1

Setup

Analysis

Report

## Session 2

→ Background

Setup

Task 1

Task 2

Task 3

$$d = \frac{X}{2} \sqrt{\frac{V_2 - V_1}{V_2 + V_1}}$$

Naik, Malhotra, Popovics

# Rate Effects

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

Task 3

- Viscoelastic response
  - Later in semester
- Faster = Stiffer

Long-Term  
Behavior

Creep

Static

Non Destructive  
Testing (ex. UPV)

Earthquake

Impact

Blast

Slow

Typical  
Load Rate  
25-50 psi/sec

Strain Rate ( $\text{sec}^{-1}$ )

Fast

# UPV Machine (1970s)

## Session 1

Setup

Analysis

Report

## Session 2

Background

➔ Setup

Task 1

Task 2

Task 3

Pulse generator/receiver has a timer which measures the transit time ( $\mu\text{s}$ )

# UPV Machine (2011)

## Session 1

Setup

Analysis

Report

## Session 2

Background

➔ Setup

Task 1

Task 2

Task 3

Pulse generator/receiver has a timer which measures the transit time ( $\mu\text{s}$ )

# Wave Speed

## Session 1

Setup

Analysis

Report

## Session 2

Background

➔ Setup

Task 1

Task 2

Task 3

- Machines give transit time ( $t$ )

$$- C = \frac{L}{t}$$

$C$ : wave speed [m/s]

$L$ : dist. between electrodes or length of sample [m]

$t$ : transit time [s] (convert from what's given on machine in  $\mu\text{s}$ )

For some reason, convention in this field uses “ $C$ ” for wave speed

$$- C = \sqrt{\frac{E(1-\mu)}{\rho(1+\mu)(1-2\mu)}}$$

\*this is good only for p-waves

$C$ : wave speed [m/s]

$\mu$ : Poisson's ratio

$\rho$ : density [ $\text{kg/m}^3$ ]

# Session 2 Objectives

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

→ Task 1

Task 2

Task 3

- Learn the principles of dynamic non-destructive testing (NDT), technology known as ultrasonic pulse velocity (UPV)
- Determine E of common homogeneous materials
- Determine E of plaster/alum composites
  - Volume fraction effects
- Evaluate structural integrity in the field

# Task 1: Homogeneous Materials

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

→ Task 1

Task 2

Task 3

- Measure mass and dimensions ( $\rho$ )
- Measure transit time
- Compute velocity

SAMPLE	Mass (g)	Length (mm)	Diameter (mm)	Time ( $\mu$ s)	Speed (m/s)
Steel					
Copper					
Aluminum					
HDPE					
Glass					

# Task 1: Homogeneous Materials

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

→ Task 1

Task 2

Task 3

- Compute E
- Compare to literature values
  - Credible sources
    - [http://www.engineeringtoolbox.com/young-modulus-d\\_417.html](http://www.engineeringtoolbox.com/young-modulus-d_417.html)
  - Why might there be differences?
- Summary Table

SAMPLE	Density (g/cm <sup>3</sup> )	Pulse Velocity (m/s)	Elastic Modulus (Gpa)
Steel			
Copper			
Aluminum			
HDPE			
Glass			

# Task 2: Particulate Composites

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

➔ Task 2

Task 3

- Plaster Matrix / Aluminum dispersion

- 5 specimens
  - 100 % plaster
  - 100 % Al
  - 3 composites

# $E$ v $V_{al}$ (Fig. 3)

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- Experimental Data Points of  $E$  v  $V_{al}$

# Calculations

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

➔ Task 2

Task 3

- Measure transit time
- Compute velocity
- Elastic Modulus

$$- C = \sqrt{\frac{E(1-\mu)}{\rho(1+\mu)(1-2\mu)}}$$

For some reason, convention in this field uses “C” for wave speed

- $\mu$  and  $\rho$  are different for each sample (see previous slides)

# Determine $\rho$ and $V_{al}$ (Fig. 1)

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

➔ Task 2

Task 3

- Mass / dimensions  $\rightarrow \rho$
- Determine  $V_{al}$  for each of specimens

# Determine $\mu$ (Fig. 2)

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

→ Task 2

Task 3

- $V_{al} \rightarrow \mu$
- $\mu_{al} = 0.33$
- $\mu_{plaster} = 0.15$

# $E$ v $V_{al}$ Models (Fig. 3)

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- Models can be used to predict intermediate values of  $E$
- Theoretical relationships that involve some assumptions
- Parallel and Series Model
- These will be covered in detail with Dr. Weiss

# Series $E$ v $V_{al}$ Models (Fig. 3)

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- Parallel (Voight) Law

# Series $E$ v $V_{al}$ Models (Fig. 3)

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- Series (Reuss) Law

$$\frac{1}{E_C} = \frac{V_{PL}}{E_{PL}} + \frac{V_{AL}}{E_{AL}}$$

$$V_{PL} + V_{AL} = 1$$

# Model Conventions

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- There are some general rules when showing experimental data and models on the same plot
- Experimental Data
  - Measured points
  - Not connected with a line
- Model Data
  - No data points
  - Continuous: Use lines and a large number of points to define the curve

# Report

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- Summary Table

SAMPLE	Density (kg/m <sup>3</sup> )	$V_{al}$	Poisson's Ratio $\mu$	Time ( $\mu$ s)	Elastic Modulus (MPa)
1					
2					
3					
Aluminum					
Plaster					

- Figures

- $\rho \ v \ V_{al}$

- $\mu \ v \ V_{al}$

- $E \ v \ V_{al}$  with both models (make sure to describe these models in the report)

# Task 3: Field Investigation

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- Movement of a newly constructed wall during loading has raised concerns about the structural integrity of the wall
- The contractor cannot recall if the concrete was properly consolidated during placement

# Recall: Through Transmission

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- Through thickness CP measurements used to monitor uniformity of in-place concrete.
- Presence of "defect" increases travel time (lower speed).
- Requires access to both sides

# Task 3: Field Investigation

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

- Determine sample location and frequency (previously chosen)
- Measure wave travel time at each point, record in table

# Task 3: Field Investigation

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

➔ Task 3

Create a graphic showing the integrity of the wall based on measurements

- value  $< 50\mu\text{s}$  green
- $50\mu\text{s} < \text{value} < 100\mu\text{s}$  yellow
- value  $> 100\mu\text{s}$  red

# Task 3: Report

## Session 1

Setup

Analysis

Report

## Session 2

Background

Setup

Task 1

Task 2

→ Task 3

- Table showing values collected from lab
- Visual graphic showing integrity of the wall
  - Make sure to include a legend
- Discussion of how the defect(s) affected the wave speed within the wall

**MAKE SURE TO CHECK THE  
RUBRICS!**

# Questions?!
